

The Microsoft Safety Scanner is a free downloadable security tool that provides on-demand scanning and helps remove viruses, spyware, and other malicious software. It works with your existing antivirus software.

**<http://www.microsoft.com/security/scanner/en-us/default.aspx>**

**Note:** The Microsoft Safety Scanner expires 10 days after being downloaded. To rerun a scan with the latest anti-malware definitions, download and run the Microsoft Safety Scanner again.

**Note:** Any data files that are infected may only be cleaned by deleting the file entirely, which means there is a potential for data loss.

Hope this information is helpful.

Hello,

we had the same problem. Deleting the cab\_xxxx files only resulted in regeneration every 30min.

Checking <windows>\Logs\CBS folder I found lots of .log and (some) .cab files  
It seems, that windows wasn't able to zip (makecab.exe) one of the .log files.

Solution was:

in <windows>\Logs\CBS folder delete the oldest .log file (you can also delete them all)

in <windows>\temp folder delete every cab\_xxxx

in the following regeneration process, the remaining (CBS) logs where zipped correctly, and <windows>\temp was left clean
